

Greenland shed ice at unprecedented rate in 2019; Antarctica continues to lose mass

UCI, NASA JPL project tracking Earth-sensing satellite turnover yields striking results
Wednesday, March 18, 2020

UCI News

An aerial photograph taken Sept. 10 shows melt ponds formed in the crevasses of the highly deformed ice on the surface of Jakobshavn Glacier in central-west Greenland. A recent study by scientists at UCI and NASA's Jet Propulsion Laboratory found that the large land mass lost 600 billion tons of ice in the summer of 2019, raising global sea levels by 2.2 millimeters.

These new findings and others by glaciologists at the University of California, Irvine and NASA's Jet Propulsion Laboratory are the subject of a paper published today in the American Geophysical Union journal [*Geophysical Research Letters*](#).

"We knew this past summer had been particularly warm in Greenland, melting every corner of the ice sheet, but the numbers are enormous," said lead author [*Isabella*](#)

[Velicogna](#), UCI professor of Earth system science and JPL senior scientist.

Between 2002 and 2019, Greenland lost 4,550 billion tons of ice, an average of 268 billion tons annually – less than half what was shed last summer. To put that in perspective, Los Angeles County residents consume 1 billion tons of water per year.

“In Antarctica, the mass loss in the west proceeds unabated, which is very bad news for sea level rise,” Velicogna said. “But we also observe a mass gain in the Atlantic sector of East Antarctica caused by an increase in snowfall, which helps mitigate the enormous increase in mass loss that we’ve seen over the last two decades in other parts of the continent.”

She and her colleagues came to these conclusions in the process of establishing data continuity between the recently decommissioned Gravity Recovery and Climate Experiment satellite mission and its new and improved successor, GRACE Follow-On.

A project of NASA and the German Aerospace Center, the twin GRACE satellites were designed to make extremely precise measurements of changes in Earth’s gravity. The spacecraft have proven to be particularly effective at monitoring the planet’s water reserves, including polar ice, global sea levels and groundwater.

The first GRACE mission was deployed in 2002 and collected data for more than 15 years, a decade longer than its intended life span. Toward the end of this period, the GRACE satellites began to lose battery power, leading to the end of the mission in October 2017.

GRACE Follow-On – based on a similar technology but also including an experimental instrument using laser interferometry instead of microwaves to gauge minute changes in distance between the twin spacecraft – was launched in May 2018. The gap between the missions made it necessary for Velicogna and her cohort to test how well data amassed by the GRACE and GRACE-FO missions matched.

“It’s great to see how well the data line up in Greenland and Antarctica, even at the regional level,” she said. “It’s a tribute to the months of effort by the project, engineering and science teams to make the endeavor successful.”

In addition to scientists from UCI and NASA JPL, the GRACE and GRACE-FO data continuity project involved researchers from France’s University of Grenoble, the Netherlands’ Utrecht University and the University of Washington’s Polar Science

Center.

About the University of California, Irvine: Founded in 1965, UCI is the youngest member of the prestigious Association of American Universities. The campus has produced three Nobel laureates and is known for its academic achievement, premier research, innovation and anteater mascot. Led by Chancellor Howard Gillman, UCI has more than 36,000 students and offers 222 degree programs. It's located in one of the world's safest and most economically vibrant communities and is Orange County's second-largest employer, contributing \$5 billion annually to the local economy. For more on UCI, visit www.uci.edu.

Media access: Radio programs/stations may, for a fee, use an on-campus ISDN line to interview UCI faculty and experts, subject to availability and university approval. For more UCI news, visit news.uci.edu. Additional resources for journalists may be found at communications.uci.edu/for-journalists.
